DETAILED ACTION

1. Claims 1, 2, 4-20, 22-35, and 37-67 are pending.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

3. Claims 1, 2, 4-20, 22-35, and 37-67 are rejected under 35 U.S.C. 102(e) as being anticipated by Bell, 6,088,370.

As to claims 1, 2, 4-20, 22-35, and 37-67, Bell discloses the invention substantially as claimed, as Bell discloses an interface to transfer data directly between a memory control hub (MCH) and an input/output control hub (ICH) within a computer system, comprising a data signal path to transmit data in packets via split transactions, and a set of command signals, wherein the interface provides a point-to-point connection between the MCH and the ICH, exclusive of an external bus connected directly to the interface, wherein information is transmitted in source synchronous clock mode via request and completion packets including transaction descriptors (note Figures 1 and 2A and column 2, line 15 – column 3, line 25, wherein Bell discloses in column 2, lines 20-25 that the controller 115 can function as a bridge between a memory bus to which one or more memory devices are connected. Examiner is taking

Art Unit: 2181

the controller operating in this manner to be the memory control hub. Bell also discloses in column 2, lines 25-32 that the bus expander bridge 120 is coupled to two PCI buses 122 and 123, both of which have PCI devices coupled thereto. Examiner is taking the PCI devices coupled to the PCI buses to be I/O devices, and therefore the expander bridge 120 reads on the input/output control hub (ICH).)

Response to Arguments

4. Applicant's arguments filed 1/25/02 have been fully considered but they are not persuasive for the following reason:

The expander bridges as shown in Bell are different than the input/output control hub as claimed by applicant in that the expander bridges have more limited capability. As defined in applicant's detailed description, the ICH is a hub that is capable of providing an interconnection between various peripheral components and external buses, with a separate bus interface.

It is the examiner's position that bus expander bridge 120 meets the definition cited in applicant's detailed description, since bus expander bridge 120 is capable of providing an interconnection between various peripheral components (i.e., the ones on PCI buses 122 and 123) and external buses (i.e., PCI buses 122 and 123), with a separate bus interface.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure, as the art discloses a point-to-point link between a memory control hub and a input/output control hub.
